Excerpt: .For n!5 it is holoedrically isomorphic to the symmetric group in n letters. It contains a sub-group of collineations permuting amongst themselves certain n-1 fundamental points, and first given by Klein. Prof. Moore s group results from extending that of Prof. Klein by an inversion having n-2 of the fundamental points as critical points and the remaining one as a fixed point. This paper is intended for the Mathematische Annalen. In Dr. Snyder s paper Lie s haxaspherical coordinates were employed to define, without the use of line-geometry, a Dupin s cyclide. By associating the three simultaneous linear equations of definition with the point-complex and the plane-complex, one obtains determinants the signs of which indicate the reality of spheres common to the four complexes and thus show the presence of nodes. Dr. Snyder s paper will appear in the Annals of Mathematics. On a convex surface of deficiency zero Euler s equation, together with the requirement of numerical regularity, gives three sets of integers for vertices, faces and edges of a polyedron. These by duality become five, corresponding to the five regular polyedra. On a surface of deficiency greater than unity the modified equation of Euler, together with similar limitations, gives again a finite number of sets of integers for vertices, faces and edges. These sets are of two sorts: derivative, obtained from sets belonging to lower deficiencies; and special, not so obtainable, but peculiar to the deficiency in question. These sets of characteristic numbers...
